EDUCATION

Guru Nanak Dev Engineering College

Bachelor of Technology(B.Tech) in Computer Science and Engineering

Ludhiana,Punjab,India

Nov. 2022 – May 2026

BCM Arya Model Senior Secondary School

Class XII CBSE (90.6%)

Ludhiana,Punjab,India

March 2021 – July 2022

BCM Arya Model Senior Secondary School

Class X CBSE (90.6%)

Ludhiana,Punjab,India

March 2019 – July 2020 .

EXPERIENCE

Machine learning intern(Yugant Industries,Kolkata,WestBengal)

- Developed and deployed a customer support chatbot for an e-commerce platform to automate user queries and improve response time.
- Integrated Processing (NLP) to handle FAQs, order tracking, and complaint resolution efficiently
- Collaborated with the support team to fine-tune chatbot responses, improving accuracy and customer satisfaction
- Reduced manual query load by 40%.

PROJECTS

Feateng

- Developed and published a Python feature engineering library on **PyPI**, enabling streamlined preprocessing and feature selection for machine learning workflows.
- Integrated feature selection techniques (VarianceThreshold, RFECV, SelectFromModel) and resampling methods (SMOTE, ADASYN, under/over-sampling) to handle imbalanced datasets
- Packaged the project with modular structure, unit tests, and CI/CD workflows, ensuring reliability and maintainability
- Decreased the time and increase the productivity by 40-50% by automating all important functions.

Movie Recommender System

- Built a **movie recommendation system** leveraging **Neural Collaborative Filtering (NCF)**, **Matrix Factorization**, and **User-Item Collaborative Filtering** techniques to personalize content suggestions..
- Designed and trained **deep learning–based NCF models** with embedding layers for users and items, achieving improved prediction accuracy over traditional methods
- Implemented **Matrix Factorization with SGD/ALS optimization**, reducing error rates in rating predictions.
- Develop the system as a prototype application, enabling users to receive real-time movie recommendation based on historical preferences

Vehicle Insurance System

- Developed an AI-driven web application using machine learning models (Scikit-learn) to predict insurance risk from user inputs such as age, driving licence status, and vehicle age.
- Employed data preprocessing and feature engineering using NumPy and Pandas to clean, transform, and prepare input data for model training
- Containerized the full application with **Docker**, setting up a CI/CD pipeline via **GitHub Actions** to automate building, testing, and deployment.
- Hosted infrastructure on AWS, including using container registries (ECR) for image management, and integrated cloud storage or database services (MongoDB, Amazon S3) to store user info, logs, and potentially other assets

Framify

- Automatic extraction of video frames and pairing with slide summaries to assist remote learners in retaining content
- Built a full stack processing pipeline with python which Input videos→Extract slides→Generate summaries→Output formatted Notes.
- Built Full pipeline with langchain to gets input with OCR chain and produce summary based on the input.
- Added modular code architecture including data ingestion, prompt management, and utility modules to improve maintainability and scalability.

A

ACTIVITIES

AIESEC

- Collaborated with international AIESEC chapters to organize global volunteer initiatives, fostering partnerships and ensuring smooth communication across diverse teams.
- Generated revenue of ₹20,000 for the community by securing sponsorships to fund cross-cultural exchange events, enabling the successful organization of impactful programs

T

TECHNICAL SKILLS

Languages: Python, C/C++

Frameworks: Tensorflow , Pytorch, Git,Docker, Kubernetes, AWS, DVC, Fastapi

Field Expertise: GEN AI, ML, NLP, CV, MLOPS
